

Web Page Analysis

ECC006 – Homework Assignment #8, Part 2 | Two web pages: one appealing, one unappealing

APPEALING

Example 1 – Stripe

A. URL

<https://stripe.com>

B. DOES THIS PAGE USE TABLES?

The Stripe homepage does not use HTML tables for layout. Content is structured entirely through CSS Flexbox and Grid. Tables are not present for data display on the main landing page, which reflects modern best practice of separating content from layout.

C. DOES THIS PAGE USE CSS?

Yes, extensively. Stripe uses CSS for all aspects of the page: full layout and responsive grid, custom typography, animated gradient backgrounds, hover effects on buttons and cards, and color theming. CSS is central to the brand identity and the smooth animated hero section.

D. IS THIS PAGE APPEALING? LIST THREE REASONS.

Yes, it is appealing.

- The animated gradient background in the hero section is eye-catching and gives the page a modern, dynamic feel without distracting from the content.
- Typography is excellent — clear hierarchy between headings and body text makes the page easy to scan at a glance.
- Consistent color palette and generous whitespace create a sense of professionalism and trustworthiness, which is appropriate for a payments company.

E. IMPROVEMENTS (IF UNAPPEALING)

Not applicable — this page is appealing.

UNAPPEALING

Example 2 – Craigslist

A. URL

<https://craigslist.org>

B. DOES THIS PAGE USE TABLES?

Yes. Craigslist uses HTML tables as the primary layout mechanism for organizing category links on the homepage. The multi-column listing of categories (community, housing, jobs, etc.) is built with table rows and cells rather than modern CSS Grid or Flexbox.

C. DOES THIS PAGE USE CSS?

Yes, but minimally. CSS on Craigslist is used mainly for basic text styling (font size, link colors) and a simple two-column layout. There is very little

use of CSS for visual design, spacing refinement, or responsive adaptation to different screen sizes.

D. IS THIS PAGE APPEALING OR UNAPPEALING? LIST THREE REASONS.

Unappealing.

- The layout is extremely dense and text-heavy with no visual breathing room, making it difficult for new users to know where to look first.
- There are no images, icons, or visual cues — the page looks identical to a plain HTML document from the early 2000s and feels outdated and untrustworthy to modern users.
- The page is not responsive; on mobile devices the table-based layout breaks or becomes very difficult to navigate, creating a poor user experience.

E. WHAT WOULD YOU DO TO IMPROVE THIS PAGE?

I would replace the table-based layout with a CSS Grid or Flexbox system to make the page fully responsive. I would add clear section headings with small icons for each category group to aid visual navigation. A modest color accent and a slightly larger base font size would significantly improve readability. Finally, the search bar — the most important element — should be visually prominent and placed at the top center of the page rather than tucked in a small box.
